Webinar 2021

LAUMAS®

Q The **new functions** illustrated in the webinar are available with the new firmware. Is this also **compatible** with **previous instruments** made by LAUMAS and is it possible to **update** the **weight transmitters** already **installed** to be able to implement them?

A **Yes.** Customers who already own a LAUMAS multichannel instrument can **download** the new firmware **update files** via the LAUMAS service software [Instrument Manager](#).

LAUMAS®

Q

I buy a **new** multichannel **weight transmitter**, is the new firmware already **installed** on the instrument?

A

Yes. All multichannel instruments purchased after **1/12/2021** are **programmed** with the **new firmware** just presented.

LAUMAS®

Q Did the **previous firmware** already have the ability to **remotely send** some commands and settings to the weight transmitter?

A **Yes**, previous firmware versions already had some necessary operations to install and manage a weighing system remotely.

With the **new version**, however, the remote **control** is complete in terms of both **configuration** and **installation**.

LAUMAS®

Q

Can I remotely **set** or **change** the instrument's **IP address**?

A

With the **Profinet-IO** communication interface, the IP address is always and only set remotely.

This is thanks to the functions available in the **development systems** used for making the PLC software.

Webinar 2021

LAUMAS®

Q When a **load cell fails** or is subject to a **malfunction**, can an **alarm contact** be managed that activates a relay output to block the machine?

A **Yes, of course.** There is a specific function, indicated by the word **ALARM**, which can be assigned to one of the digital outputs.

In this way the relay switches when one of these **alarms** is activated:

- Load cell not connected or connected incorrectly;
- Conversion electronics failure;
- Converter in the instrument faulty;
- Weight exceeding 110 % of full scale;
- Weight exceeding the maximum capacity by 9 divisions;
- Maximum viewable value exceeded
(value greater than 999999 or less than -999999)

Q&A

Webinar 2021

LAUMAS®

Q For the **load percentages** displayed by the instrument to be correct, must a weighing system be built with multiple load cells all identical?

A When building a weighing system, using load cells of **equal sensitivity and capacity** is a rule we recommend.

To make the **indication** of the load **percentages precise**, some small differences in sensitivity can be solved through the equalization procedure.

A **tutorial** is available on our website that explains step-by-step how to [equalize multichannel transmitters](#).

LAUMAS®

Q If I have multiple load cells connected, is there a direct way to **read the weight applied** to each individual load cell, or do I have to calculate it from the total using the respective percentages?

A For **multichannel instruments** that allow managing a **single scale** with multiple weighing points, this function is not yet available. However, we have decided to develop it in the **new generation** of LAUMAS instruments that are at the design stage.

LAUMAS®

Q

With the functions available in the new firmware, can I calculate the **weight deviation** to the right/left in an application on a **weighing belt**?

A

Yes, from the description of the application it seems possible. It is sufficient to install a number of load cells for weighing the belt and, using the **functions** that can be accessed **remotely**, to take advantage of the reading of the load percentages.

LAUMAS®

Q

Is it **mandatory** to perform the **equalization** procedure for each individual load cell?

A

No, performing the equalization procedure is not mandatory.

You need to **evaluate** whether or not to perform it **according to**:

- the **operating specifications** of its application;
- the **results** of a specific **test** to evaluate the effects on the calculated weight of any values of a different sensitivity between the installed load cells.

LAUMAS®

Q

Does it make sense to perform load cell **equalization** on an already inherently **unbalanced weighing system**?

A

If the system is unbalanced due to operating specifications, there is no need to perform equalization.

Webinar 2021

LAUMAS®

If I use the **Ethernet/IP** protocol (for example on an Allen Bradley PLC), the supplied **.eds file** is “generic” and therefore the programmer must follow the manual to understand in which byte the command register is passed, or is it **easily recognizable** in the data structure that is seen in the controller tags?

In Ethernet/IP the .eds file is generic and contains fields that each correspond to one of the bytes exchanged on the fieldbus.

To understand in which byte the **command register** is passed, you then need to refer to the **manual**.

This choice was made for the **data structure** to be **compatible** with the two modes of operation available on multichannel instruments:

- **Managing a scale** with multiple load cells;
- **Reading the conversion points** of the individual analogue input channels of the instrument, unfiltered and uncalibrated;

LAUMAS®

Q

In the future will there be a LAUMAS weight transmitter that will support the **LoRaWan protocol**?

A

Yes. The LoRaWan interface (acronym of Long Range Wide Area Network – LPWAN) is one of those considered for the development of the new generation of LAUMAS instruments.

It is particularly suitable for **long-distance WiFi transmissions** and is very useful in monitoring applications in **remote areas** where the cellular network is not present.

LAUMAS®

Q

I have a **TLB4** with **Ethernet TCP/IP** protocol, can I use **Instrument Manager** over the Ethernet network instead of via RS485?

A

Currently Instrument Manager can only be used via a **serial connection** between PC and instrument.

The ability to connect and manage the instrument via an **Ethernet network** is one of the features we will be developing in the future.
